Role: Junior Product Support Specialist

Environment: MySQL Workbench, Postman, Microsoft Word

SUP-001 — Customer Unable to Access Account
Customer: Sophie Turner
Customer ID: 1005
Priority: Medium
Status: Resolved / Investigation Complete

Customer Issue
Customer reported that she was unable to access the NexusCloud service despite previously having access.

Investigation
1. Queried the customer's account using customer ID 1005.
2. Found the account status was Inactive.
3. Queried the customer's subscription record.
4. Found the Pro subscription status was Expired, with a renewal date of 28/09/2026.
5. Used a SQL JOIN to verify the customer and subscription information together.

Finding
The expired subscription is consistent with the customer's account being inactive and the reported loss of access.

Next Action / Resolution
Verify NexusCloud's subscription/access rules. If an expired subscription disables account access, advise the customer to renew/reactivate their subscription.

SQL Investigation Evidence

```
51 •  SELECT
52        customers.customer_id,
53        customers.name,
54        customers.account_status,
55        subscriptions.plan,
56        subscriptions.subscription_status,
57        subscriptions.renewal_date
58    FROM customers
59    JOIN subscriptions
60    ON customers.customer_id = subscriptions.customer_id
61    WHERE customers.customer_id = 1005;
62
```

Result Grid | Filter Rows: | Export: | Wrap Cell Content:

customer_id	name	account_status	plan	subscription_status	renewal_date
1005	Sophie Turner	Inactive	Pro	Expired	2026-09-28

Result
Customer 1005 had an Inactive account and an Expired Pro subscription, with a renewal date of 28/09/2026.

Environment: MySQL Workbench, Postman, Microsoft Word

SUP-002 — Customer Unable to Find Order
Customer: Marcus Reed
Customer ID: 1004
Priority: Medium
Status: Escalation Required

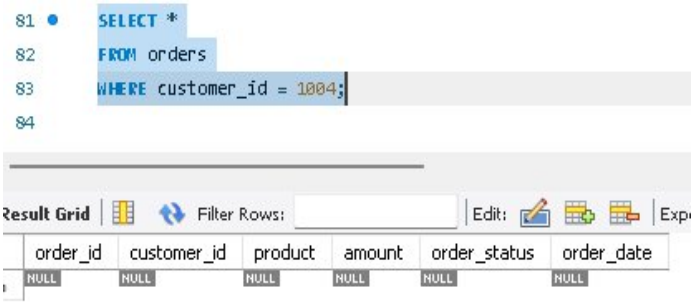

Customer Issue
Customer reported that a recent NexusCloud Analytics order was not visible in his account. Customer stated that the order was placed on 08/10/2026.

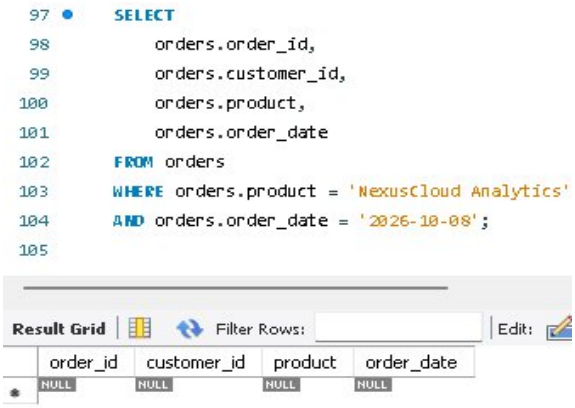

Investigation
1. Queried the orders table using customer ID 1004.
2. No orders were associated with the customer's account.
3. Joined the orders and customers tables to review existing orders alongside customer information.
4. Confirmed that no existing order was associated with Marcus Reed.
5. Searched for a NexusCloud Analytics order dated 08/10/2026 using multiple conditions.
6. No matching order was found in the available order data.

Finding
The available database records do not contain an order associated with customer 1004 or an order matching the product and date provided by the customer. The available evidence is therefore insufficient to confirm why the reported order is missing.

Next Action / Resolution
Escalate for further investigation with the customer's order details and SQL findings. Additional information such as a payment reference, order confirmation number or transaction record could be requested to determine whether the order was successfully created.

SQL Investigation Evidence

Result
No order was found for customer 1004. A secondary search using the product name and order date provided by the customer also returned no matching records.

Environment: MySQL Workbench, Postman, Microsoft Word

SUP-003 — Customer Subscription Information Incorrect
Customer: Daniel Brooks
Customer ID: 1002
Priority: Medium
Status: Escalation Required

Customer Issue
Customer reported upgrading his subscription to Pro, but his NexusCloud account continued to display the Basic plan. Customer stated that payment had already been made.

Investigation
1. Queried the customer's subscription record using customer ID 1002.
2. Confirmed the subscription was Active but the plan remained Basic.
3. Queried the customer's order history for supporting transaction information.
4. Found a completed NexusCloud Analytics order for £39.99 dated 03/10/2026.
5. Used a SQL JOIN to verify the customer's account and subscription information together.
6. Confirmed the account was Active, while the subscription remained Basic.

Finding
The customer's account and subscription are active, but the subscription is still recorded as Basic. A completed £39.99 NexusCloud Analytics order exists, but the available data does not establish that this transaction represents the reported Pro upgrade.

Next Action / Resolution
Escalate for verification of the customer's payment and subscription upgrade transaction. The subscription should not be manually changed until the upgrade has been confirmed.

SQL Investigation Evidence

```
118 •  SELECT
119        customers.customer_id,
120        customers.name,
121        customers.account_status,
122        subscriptions.plan,
123        subscriptions.subscription_status,
124        subscriptions.renewal_date
125    FROM customers
126    JOIN subscriptions
127    ON customers.customer_id = subscriptions.customer_id
128    WHERE customers.customer_id = 1002;
129
```

Result Grid | Filter Rows: | Export: | Wrap Cell Content:

customer_id	name	account_status	plan	subscription_status	renewal_date
1002	Daniel Brooks	Active	Basic	Active	2026-12-01

```
114 •  SELECT *
115    FROM orders
116    WHERE customer_id = 1002;
117
```

Result Grid | Filter Rows: | Edit: | Export/Import:

order_id	customer_id	product	amount	order_status	order_date
7002	1002	NexusCloud Analytics	39.99	Completed	2026-10-03
NULL	NULL	NULL	NULL	NULL	NULL

Result
Customer 1002 has an active account and subscription, but the plan remains Basic. A completed £39.99 NexusCloud Analytics order was identified, but the available data does not confirm that it represents the reported Pro upgrade.

Environment: MySQL Workbench, Postman, Microsoft Word

SUP-004 — API Authentication Failure
Customer: Integration Customer
Priority: High
Status: Authentication Issue Identified

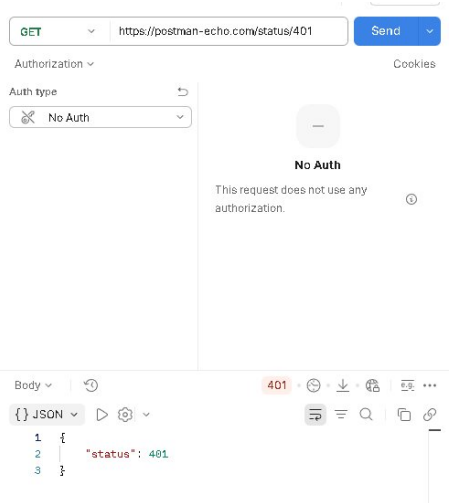

Customer Issue
Customer reported that their NexusCloud integration was failing and API requests were being rejected.

Investigation
1. Reproduced the API failure using Postman.
2. Sent a GET request and received an HTTP 401 response.
3. Checked the request's Authorization configuration.
4. Found that the request was configured with No Auth.
5. Tested how a Bearer Token would be supplied through Postman and verified that authentication credentials are passed through an Authorization header.
6. Identified missing authentication as a likely cause requiring credential/configuration verification.

Finding
The API returned HTTP 401, indicating an authentication failure. The reproduced request was configured with No Auth, meaning no authentication credentials were supplied.

Next Action / Resolution
Verify the customer's NexusCloud API credentials and ensure the required authentication method is configured correctly. If using Bearer authentication, confirm that a valid, current token is being supplied. Do not expose API tokens in ticket notes or screenshots.

API Investigation Evidence

Result
A GET request without authentication returned HTTP 401. The request was configured with No Auth, supporting an authentication/configuration issue as the likely cause.

SUP-005 — Order Lookup Input Handling
Customer: Amelia Carter
Customer ID: 1001
Priority: Medium
Status: Reproduced / Further Investigation Required

Customer Issue
Customer reported inconsistent order lookup behaviour when an order ID contained accidental trailing whitespace.

Investigation
1. Created a GET request in Postman using order_id=7001.
2. Confirmed the API received the value as "7001".
3. Added a trailing space to the order ID and repeated the request.
4. Confirmed the API received the value as "7001 ", preserving the trailing whitespace.
5. Repeated the trailing-space test three times and reproduced the behaviour consistently.
6. Retested using the original value 7001 and confirmed normal input was received without the additional whitespace.

Finding
Testing confirmed that trailing whitespace remained part of the transmitted order_id value. Further investigation would be required to determine whether NexusCloud validates or normalises this input before performing an order lookup.

Expected Behaviour
NexusCloud should either handle surrounding whitespace safely or return a clear validation response for an incorrectly formatted order ID.

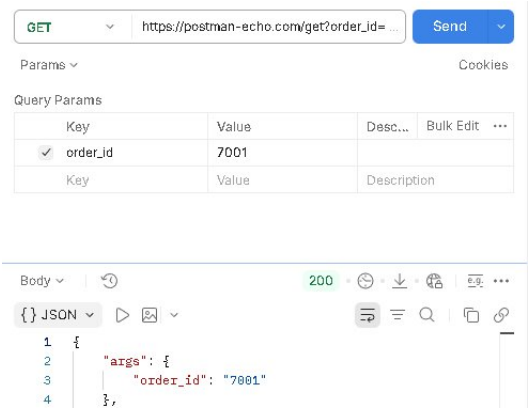

Observed Behaviour
The API test response preserved the trailing whitespace in the order_id parameter.

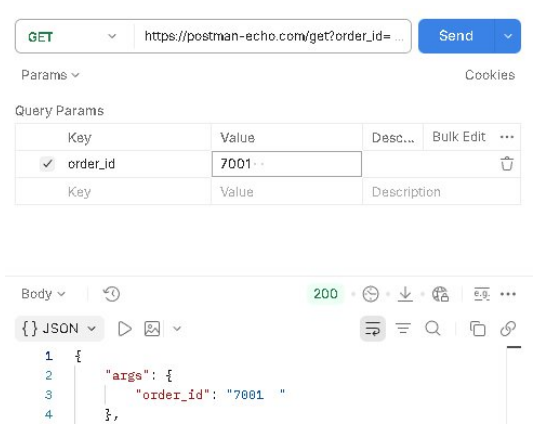

Reproducibility: 3/3

Potential Impact
If NexusCloud performs exact order-ID matching without input normalisation or validation, accidental whitespace could potentially cause a valid order lookup to fail.

Next Action / Resolution
Escalate the reproducible input-handling behaviour for engineering review. Include the affected parameter, reproduction steps, expected versus observed behaviour and supporting Postman evidence.

API Investigation Evidence

Result
Normal input returned order_id: "7001", while input containing a trailing space returned order_id: "7001 ". The behaviour was reproduced consistently across three tests.

Environment: MySQL Workbench, Postman, Microsoft Word

SUP-006 — Pending Order / Product Access Escalation
Customer: Ethan Walker
Customer ID: 1006
Priority: High
Status: Escalation Required

Customer Issue
Customer reported being unable to access NexusCloud Backup despite having an active account and subscription.

Investigation
1. Queried the customer's account and subscription records using customer ID 1006.
2. Confirmed the account was Active.
3. Confirmed the Basic subscription was Active, with a renewal date of 05/11/2026.
4. Queried the customer's order records and identified NexusCloud Backup order 7003.
5. Confirmed the £14.99 order remained in Pending status.
6. Constructed and tested a GET request in Postman using order ID 7003 and status Pending.
7. Received HTTP 200 OK and verified that the supplied parameters were correctly transmitted in the API test.

Finding
The customer's account and subscription are active, while the NexusCloud Backup order remains Pending. This is consistent with the reported access problem, but the available evidence does not prove that the Pending order is directly responsible for the loss of access.

Next Action / Escalation
Escalate order 7003 for further investigation into why it remains Pending. Provide the customer ID, order ID, product, status, SQL findings and API test evidence. Confirm the order-processing outcome before making changes to the customer's access.

Engineering Escalation Note
Issue: Customer unable to access NexusCloud Backup.
Customer ID: 1006
Order ID: 7003
Product: NexusCloud Backup
Order Status: Pending
Account Status: Active
Subscription Status: Active
Impact: Customer unable to access expected product functionality.

Investigation Completed:
SQL checks confirmed that the account and subscription are active while Backup order 7003 remains Pending. A Postman GET request was also used to validate the construction and transmission of the affected order parameters.

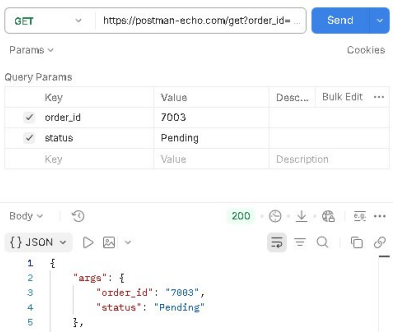

Request to Engineering / Operations:
Please investigate why order 7003 remains Pending and whether this is preventing NexusCloud Backup access.

Technical Investigation Evidence

```
142 •  SELECT
143        customers.customer_id,
144        customers.name,
145        orders.order_id,
146        orders.product,
147        orders.amount,
148        orders.order_status,
149        orders.order_date
150    FROM customers
151    JOIN orders
152    ON customers.customer_id = orders.customer_id
153    WHERE customers.customer_id = 1006;
```

Result Grid | Filter Rows: | Export: | Wrap Cell Content:

customer_id	name	order_id	product	amount	order_status	order_date
1006	Ethan Walker	7003	NexusCloud Backup	14.99	Pending	2026-10-05

Result
SQL investigation identified NexusCloud Backup order 7003 in Pending status while the customer's account and subscription remained Active. A Postman GET test successfully transmitted the affected order ID and status parameters and returned HTTP 200.
